

## Problem Statement

COVID-19 makes it hard to meet new people, especially in school.  
Students may struggle to ask peers for help when needed.  
Limited networking is also an issue for the numerous group projects in SUTD.

Account creation will store user's email and password to **Firebase**.

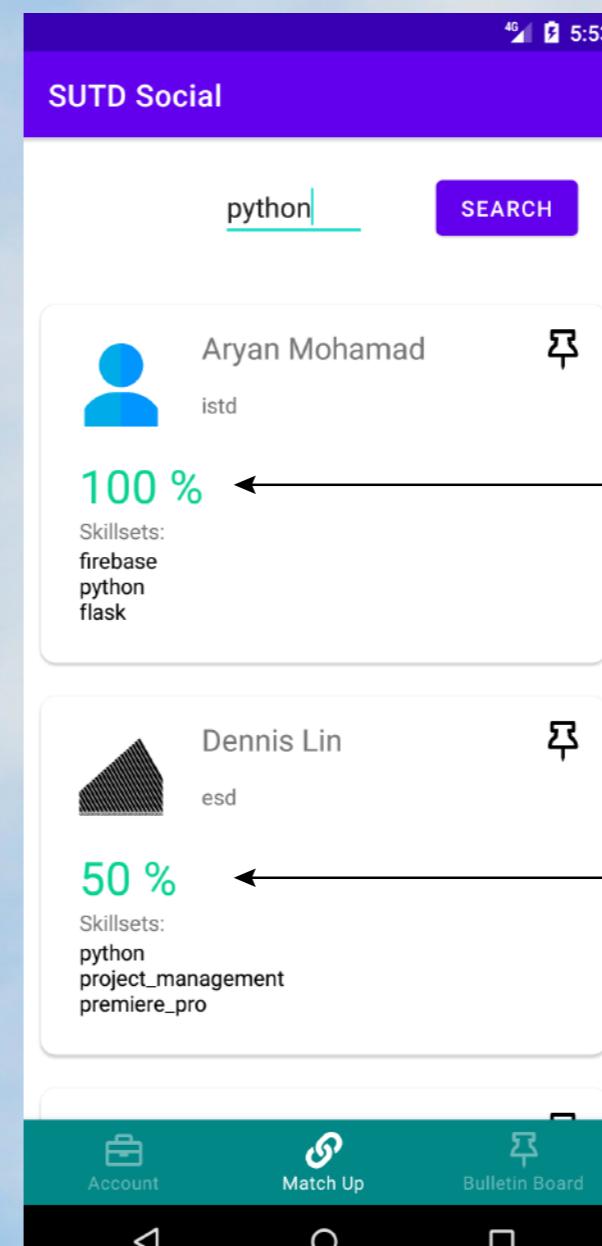

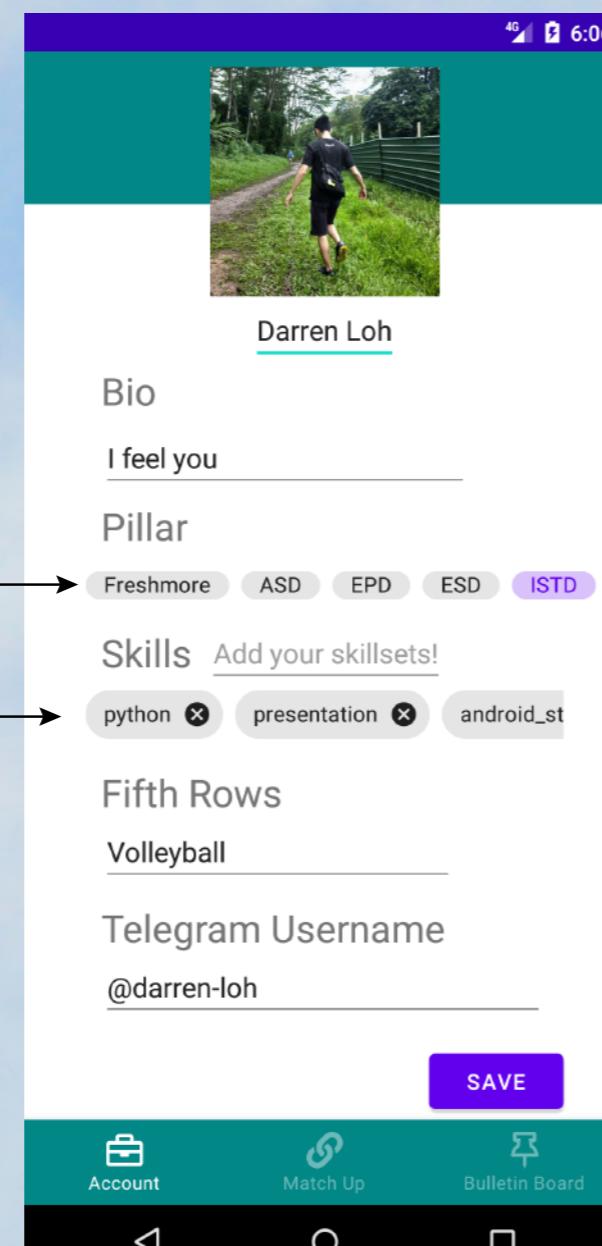

The app utilises **Firebase authentication** to keep users logged in, so signing in only needs to be done once.

Users can **set, and edit, their profile information** on the account page.

**Choice chips** are used for Pillar selection, whereas **Entry chips** are used for users' skills.

Users can set their individual **confidence levels for each skill** by clicking on the respective chips.

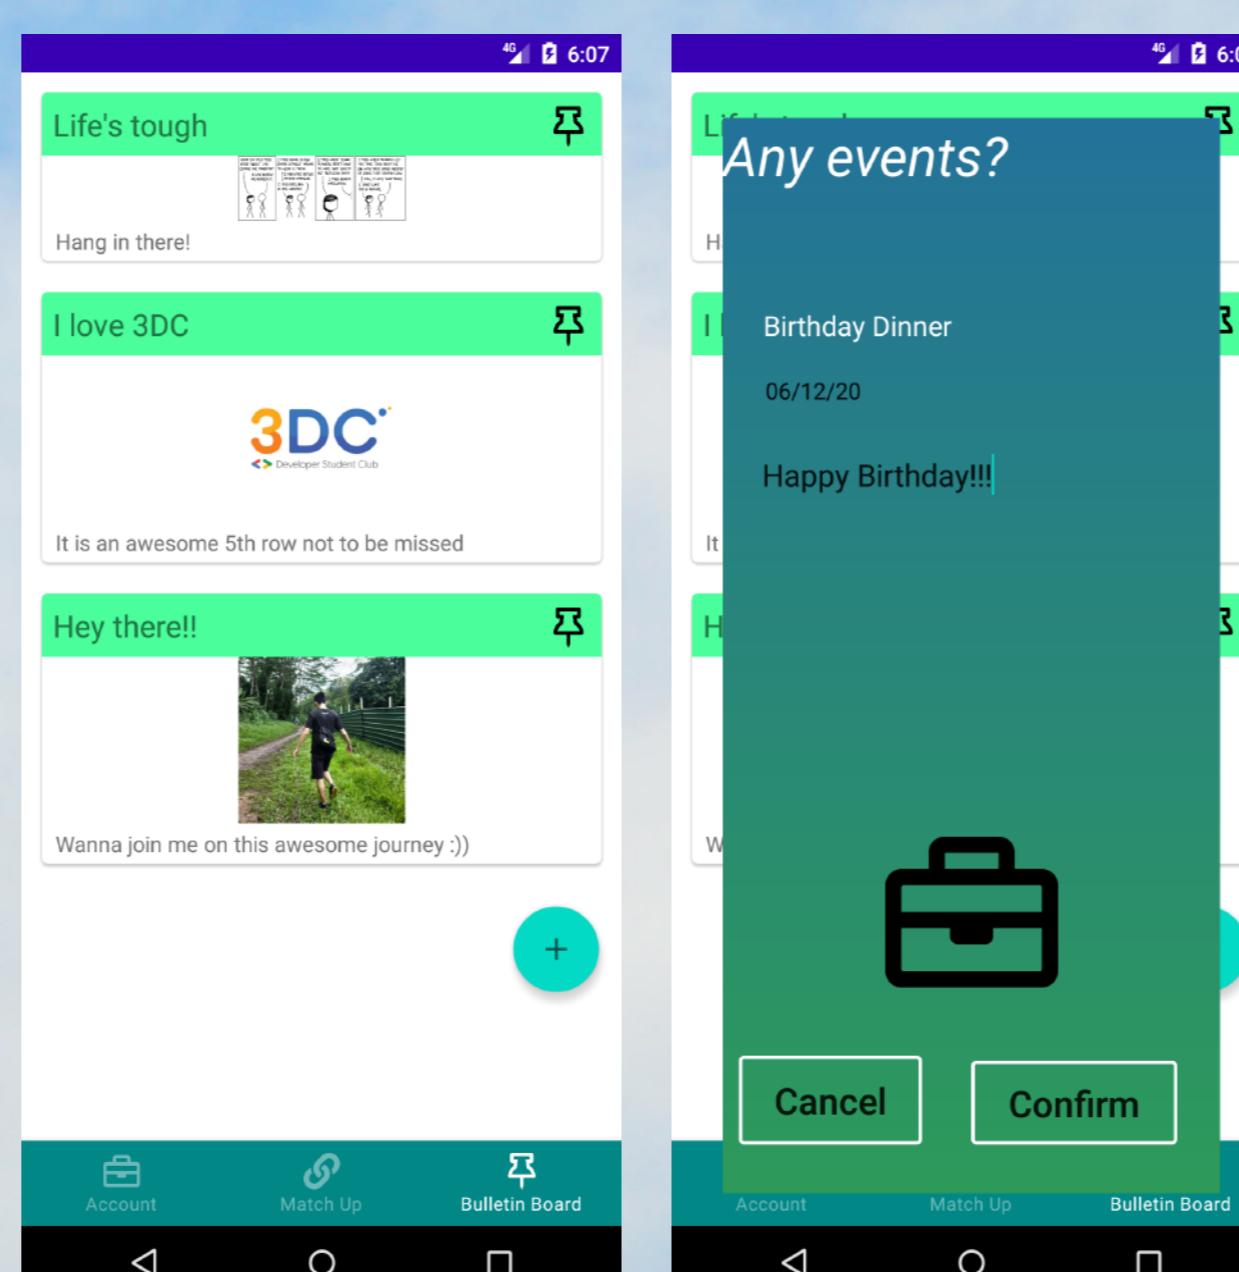

The **matching algorithm** helps students find fellow peers who possess the skills they seek.

Match percentages are calculated based on **skill confidence levels across all users**.

The **multi-purpose bulletin board** can be used for anything and everything SUTD-related!

Users can **refine their personal newsfeeds** using various filters to customise the type of posts they see.

Students can also **create their own posts** to share with the SUTD community!
